$^3$ H

# Nuclide Safety Data Sheet Hydrogen-3 [Tritium]

 $^3$ H

## I. PHYSICAL DATA

Radiation: Beta (100% abundance)

Energy: Max.: 18.6 keV; Average: 5.7 keV

Half-Life  $[T_{1/2}]$ : Physical  $T_{1/2}$ : 12.3 years

Biological  $T_{\frac{1}{2}}$ : 10 - 12 days Effective  $T_{\frac{1}{2}}$ : 10 - 12 days\*

\* Large liquid intake (3-4 liters/day) reduces effective T<sub>1/2</sub> by a factor of 2+; <sup>3</sup>H is easily

flushed from the body

Specific Activity: 9650 Ci/g [357 TBq/g] max.

Beta Range: Air: 6 mm [0.6 cm; 0.25 inches]

Water: 0.006 mm [0.0006 cm; 3/10,000 inches]

Solids/Tissue: Insignificant [No <sup>3</sup>H betas pass through the dead layer of skin]

## II. RADIOLOGICAL DATA

Radiotoxicity: Least radiotoxic of all nuclides; CEDE, ingestion or inhalation:

Tritiated water: 1.73E-11 Sv/Bq (0.064 mrem/uCi) of <sup>3</sup>H intake Organic Compounds: 4.2E-11 Sv/Bq (0.16 mrem/uCi) of <sup>3</sup>H intake

Critical Organ: Body water or tissue

Exposure Routes: Ingestion, inhalation, puncture, wound, skin contamination absorption

Radiological Hazard: External Exposure - None from weak <sup>3</sup>H beta

Internal Exposure & Contamination - Primary concern

## III. SHIELDING

None required - not an external radiation hazard

## IV. DOSIMETRY MONITORING

Urine bioassay is the only readily available method to assess intake [for tritium, no intake = no dose] Be sure to provide a urine sample to Radiation Safety for confirmatory bioassay whenever your annual <sup>3</sup>H use exceeds 8 mCi. If negative, no further bioassay is required unless use exceeds 100 mCi at one time or 1000 mCi in one year, or after any accident/incident in which an intake is suspected

## V. DETECTION & MEASUREMENT

Liquid Scintillation Counting is the only readily available method for detecting <sup>3</sup>H NOTE: PORTABLE SURVEY METERS WILL NOT DETECT LABORATORY QUANTITIES OF <sup>3</sup>H

## VI. SPECIAL PRECAUTIONS

- Avoid skin contamination [absorption], ingestion, inhalation, & injection [all routes of intake]
- Many tritium compounds readily penetrate gloves and skin; handle such compounds remotely and wear double gloves, changing the outer pair at least every 20 minutes.
- While tritiated DNA precursors are considered more toxic that <sup>3</sup>H<sub>2</sub>O, they are generally less volatile and hence do not normally present a greater hazard
- The inability of direct-reading instruments to detect tritium and the slight permeability of most material to [tritiated] water & hydrogen [tritium] facilitates undetected spread of contamination. Use extreme care in handling and storage [e.g. sealed double or multiple containment] to avoid contamination, especially with high specific activity compounds.

 $^{14}C$ 

## Nuclide Safety Data Sheet Carbon-14

14C

## I. PHYSICAL DATA

Radiation: Beta (100% abundance)

Energy: Max.: 156 keV; Average: 49 keV Half-Life  $[T_{1/2}]$ : Physical  $T_{1/2}$ : 5730 years

Biological T<sub>1/2</sub>: 12 days

Effective T<sub>1/2</sub>: Bound - 12 days; unbound - 40 days

Specific Activity: 4.46 Ci/g [0.165 TBq/g] max.

Beta Range: Air: 24 cm [10 inches]

Water/Tissue: 0.28 mm [0.012 inches]

[~1% of <sup>14</sup>C betas transmitted through dead skin layer, i.e. 0.007 cm depth]

Plastic: 0.25 mm [0.010 inches]

## II. RADIOLOGICAL DATA

Radiotoxicity: 0.023 mrem/uCi of <sup>14</sup>CO<sub>2</sub> inhaled;

2.09 mrem/uCi organic compounds inhaled/ingested

Critical Organ: Fat tissue [most labeled compounds]; bone [some labeled carbonates] Exposure Routes: Ingestion, inhalation, puncture, wound, skin contamination absorption

Radiological Hazard: External Exposure – None from weak <sup>14</sup>C beta

Internal Exposure & Contamination - Primary concern

## III. SHIELDING

None required - mCi quantities not an external radiation hazard

## IV. DOSIMETRY MONITORING

Urine bioassay is the most readily available method to assess intake [for <sup>14</sup>C, no intake = no dose] Provide a urine sample to Radiation Safety after any accident/incident in which an intake is suspected

## V. DETECTION & MEASUREMENT

Portable Survey Meters: Geiger-Mueller [~10% efficiency];

Beta Scintillator [~5% efficiency]

Wipe Test: Liquid Scintillation Counting is the best readily available method for counting <sup>14</sup>C wipe tests

## VI. SPECIAL PRECAUTIONS

- Avoid skin contamination [absorption], ingestion, inhalation, & injection [all routes of intake]
- Many <sup>14</sup>C compounds readily penetrate gloves and skin; handle such compounds remotely and wear double gloves, changing the outer pair at least every 20 minutes.

 $^{32}\mathbf{P}$ 

## Nuclide Safety Data Sheet Phosphorous-32

 $^{32}P$ 

## I. PHYSICAL DATA

Radiation: Beta (100% abundance)

Energy: Maximum: 1,710 keV; Average: 695 keV

Half-Life  $[T_{\frac{1}{2}}]$ : Physical  $T_{\frac{1}{2}}$ : 14.29 days

Biological T<sub>1/2</sub>: Bone ~ 1155 days; Whole Body ~ 257 days<sup>1</sup>

Effective  $T_{\frac{1}{2}}$ : 14.29 days

Specific Activity: 286,500 Ci/g [10,600 TBq/g] max.

Beta Range: Air: 610 cm [240 inches; 20 feet]

Water/Tissue: 0.76 cm [0.33 inches]
Plastic: 0.61 mm [3/8 inches]

## II. RADIOLOGICAL DATA

Radiotoxicity<sup>2</sup>: 94.7 mrem/uCi [Lung] & 15.5 mrem/uCi [CEDE] of <sup>32</sup>P inhaled

29.9 mrem/uCi [Bone Marrow] & 8.77 mrem/uCi [CEDE] of <sup>32</sup>P ingested

Critical Organ: Bone [soluble <sup>32</sup>P]; Lung [Inhalation]; GI Tract [Ingestion - insoluble compounds]

Exposure Routes: Ingestion, inhalation, puncture, wound, skin contamination absorption

Radiological Hazard: External Exposure [unshielded dose rate at 1 mCi <sup>32</sup>P vial mouth<sup>3</sup>: approx. 26

rem/hr], Internal Exposure & Contamination

## III. SHIELDING

Shield <sup>32</sup>P with 3/8 inch Plexiglas and monitor for Bremstrahlung; If Bremstrahlung X-rays detected outside Plexiglas, apply 1/8 to 1/4 inch lead [Pb] shielding outside Plexiglas
The accessible dose rate should be background but must be < 2 mR/hr

## IV. DOSIMETRY MONITORING

Wear radiation dosimetry monitoring badges [body & ring] if regularly handling mCi quantities of <sup>32</sup>P

## V. DETECTION & MEASUREMENT

Portable Survey Meters: Geiger-Mueller

Wipe Test: Liquid Scintillation Counting is an acceptable method for counting <sup>32</sup>P wipe tests

## VI. SPECIAL PRECAUTIONS

- Avoid skin contamination [absorption], ingestion, inhalation, & injection [all routes of intake].
- Store <sup>32</sup>P (including waste) behind Plexiglas shielding [3/8 inch thick]; survey (with GM meter) to check adequacy of shielding (accessible dose rate < 2 mR/hr; should be background); apply lead [Pb] shielding outside Plexiglas if needed.
- Use 3/8 inch Plexiglas shielding to minimize exposure while handling <sup>32</sup>P.
- Use tools [e.g. Beta Blocks] to handle <sup>32</sup>P sources and contaminated objects; avoid direct hand contact.
  - Always have a portable survey meter present and turned on when handling <sup>32</sup>P.
- <sup>32</sup>P is not volatile, even when heated, and can be ignored as an airborne contaminant unless aerosolized.

 $^{35}$ S

## Nuclide Safety Data Sheet Sulfur-35

 $^{35}$ S

## I. PHYSICAL DATA

Radiation: Beta (100% abundance)

Energy: Maximum: 167.47 keV; Average: 48.8 keV

Half-Life  $[T_{1/2}]$ : Physical  $T_{1/2}$ : 87.44 days

Biological T<sub>1/2</sub>: 623 days [unbound <sup>35</sup>S]; 90 days [bound <sup>35</sup>S]

Effective T<sub>1/2</sub>: 44 - 76 days [unbound <sup>35</sup>S]

Specific Activity: 42,707 Ci/g [1,580 TBq/g] max.

Beta Range: Air: 26 cm [10.2 inches]

Water/Tissue: 0.32 mm [0.015 inches]
Plastic: 0.25 mm [0.010 inches]

## II. RADIOLOGICAL DATA

Radiotoxicity<sup>1</sup>: 2.48 mrem/uCi [CEDE] of <sup>35</sup>S inhaled

0.733 mrem/uCi of 35 ingested

Critical Organ: Testis

Exposure Routes: Ingestion, inhalation, puncture, wound, skin contamination absorption

Radiological Hazard: External Exposure – None from weak <sup>35</sup>S beta

Internal Exposure & Contamination - Primary concern

## III. SHIELDING

None required - mCi quantities not an external radiation hazard

## IV. DOSIMETRY MONITORING

Urine bioassay is the most readily available method to assess intake [for <sup>35</sup>S, no intake = no dose] Provide a urine sample to Radiation Safety after any accident/incident in which an intake is suspected

## V. DETECTION & MEASUREMENT

Portable Survey Meters: Geiger-Mueller [~10% efficiency]

Beta Scintillator [~5% efficiency]

Wipe Test: Liquid Scintillation Counting is the best readily available method for counting <sup>35</sup>S wipe tests

## VI. SPECIAL PRECAUTIONS

- Avoid skin contamination [absorption], ingestion, inhalation, & injection [all routes of intake]

- Many <sup>35</sup>S compounds and metabolites are slightly volatile and may create contamination problems if not sealed or otherwise controlled. This occurs particularly when <sup>35</sup>S amino acids are thawed, and when they are added to cell culture media and incubated. Therefore vent thawing <sup>35</sup>S vials in a hood. Incubators used with <sup>35</sup>S will have an activated charcoal trap placed in the incubator. Possibility of volatilization must be taken into account when surveying after use.

<sup>45</sup>Ca

## Nuclide Safety Data Sheet Calcium-45

<sup>45</sup>Ca

## I. PHYSICAL DATA

Radiation: Beta (100% abundance)

Energy: Maximum: 257 keV; Average: 77 keV

Half-Life  $[T_{\frac{1}{2}}]$ : Physical  $T_{\frac{1}{2}}$ : 162.61 days

Biological T<sub>1/2</sub>: Bone ~ 18,000 days<sup>1</sup>

Effective T<sub>1/2</sub>: 163 Days

Specific Activity: 17,800 Ci/g [659 TBq/g] max.

Beta Range: Air: 52 cm [20 inches]

Water/Tissue: 0.062 cm [0.024 inches]
Plastic 0.053 cm [0.021 inches]

## II. RADIOLOGICAL DATA

Radiotoxicity<sup>2</sup>: 35.8 mrem/uCi [Lung] & 16.2 mrem/uCi [Bone] of <sup>45</sup>Ca inhaled

19.4 mrem/uCi [Bone] & 3.2 mrem/uCi [CEDE] of <sup>45</sup>Ca ingested

Critical Organ: Bone; Lung [Inhalation]

Exposure Routes: Ingestion, inhalation, puncture, wound, skin contamination absorption Radiological Hazard: External Exposure - mCi quantities not considered an external hazard

Internal Exposure & Contamination - Primary concern

## III. SHIELDING

None required - mCi quantities not an external radiation hazard

## IV. DOSIMETRY MONITORING

Urine bioassay is the most readily available method to assess intake. Provide a urine sample to Radiation Safety after any accident/incident in which an intake is suspected. No dosimetry badges needed to work with mCi quantities of <sup>45</sup>Ca.

## V. DETECTION & MEASUREMENT

Portable Survey Meters: Geiger-Mueller

Wipe Test: Liquid Scintillation Counting works well for counting <sup>45</sup>Ca wipe tests

## VI. SPECIAL PRECAUTIONS

- Avoid skin contamination [absorption], ingestion, inhalation, & injection [all routes of intake]

<sup>&</sup>lt;sup>1</sup> "Calcium-45 Handling Precautions", E.I. DuPont de Numours & Co., NEN Products [Boston, MA; 1985]

<sup>&</sup>lt;sup>2</sup> Federal Guidance Report No. 11 [Oak Ridge, TN; Oak Ridge National Laboratory, 1988], p. 122, 156

1251

## Nuclide Safety Data Sheet lodine-125

125**I** 

## I. PHYSICAL DATA

Radiation: Gamma - 35.5 keV (7% abundance)

X-ray - 27 keV (113% abundance)

Gamma Constant: 0.27 mR/hr per mCi @ 1.0 meter [7.432E-5 mSv/hr per MBq @ 1.0 meter]<sup>1</sup>

Half-Life  $[T_{1/2}]$ : Physical  $T_{1/2}$ : 60.14 days

Biological T<sub>1/2</sub>: 120-138 days (unbound iodine)

Effective  $T_{\frac{1}{2}}$ : 42 days (unbound iodine)

Specific Activity: 1.73E4 Ci/g [642 TBg/g] max.

## II. RADIOLOGICAL DATA

Radiotoxicity<sup>2</sup>: 3.44E-7 Sv/Bq (1273 mrem/uCi) of <sup>125</sup>I ingested [Thyroid]

2.16 E-7 Sv/Bq (799 mrem/uCi) of <sup>125</sup>I inhaled [Thyroid]

Critical Organ: Thyroid Gland

Intake Routes: Ingestion, inhalation, puncture, wound, skin contamination (absorption);

Radiological Hazard: External & Internal Exposure; Contamination

## III. SHIELDING

Half Value Layer [HVL] Tenth Value Layer [TVL]

Lead [Pb] 0.02 mm (0.0008 inches) 0.07 mm (0.003 inches)

- The accessible dose rate should be background but must be < 2 mR/hr

## IV. DOSIMETRY MONITORING

- Always wear radiation dosimetry monitoring badges [body & ring] whenever handling > 10 μCi of <sup>125</sup>I
- Conduct a baseline thyroid scan prior to first use of 1 mCi or more of radioactive iodine
- Conduct thyroid scan no earlier than 6 hours but within 72 hours of handling 1 mCi or more of <sup>125</sup>I or after any suspected intake

## V. DETECTION & MEASUREMENT

Portable Survey Meters:

Geiger-Mueller

Low Energy Gamma Detector [~19% eff. for <sup>125</sup>I] for contamination surveys

Wipe Test: Liquid Scintillation Counter or Gamma Counter

## VI. SPECIAL PRECAUTIONS

- Avoid skin contamination [absorption], ingestion, inhalation, & injection [all routes of intake]
- Use shielding [lead or leaded Plexiglas] to minimize exposure while handling mCi quantities of 125 I
- Avoid making low pH [acidic] solutions containing <sup>125</sup>I to avoid volatilization
- For Iodinations:
  - Use a cannula adapter needle to vent stock vials of <sup>125</sup>I used; this prevents puff releases
  - Cover test tubes used to count or separate fractions from iodinations with parafilm or other tight caps to prevent release while counting or moving outside the fume hood.
